

Using GIT

different version MAY WORK
DIFFERENTLY

Create a Github Account

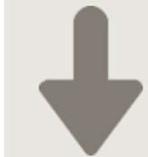

- Go to www.github.com
- Watch the Clip

Download and install Git (10 minutes)

<https://git-scm.com/downloads>

Windows (Watch the clip)

Downloading Git

Your download is starting...

You are downloading the latest **(2.32.0) 64-bit** version of **Git for Windows**. This is the most recent [maintained build](#). It was released [about 1 month ago](#), on 2021-07-06.

[Click here to download manually](#), if your download hasn't started.

Other Git for Windows downloads

[Git for Windows Setup](#)

[32-bit Git for Windows Setup](#).

[64-bit Git for Windows Setup](#).

[Git for Windows Portable \("thumbdrive edition"\)](#)

[32-bit Git for Windows Portable](#).

[64-bit Git for Windows Portable](#).

The current source code release is version **2.32.0**. If you want the newer version, you can build it from [the source code](#).

macOS

Download for macOS

There are several options for installing Git on macOS. Note that any non-source distributions are provided by third parties, and may not be up to date with the latest source release.

Homebrew

Install [homebrew](#) if you don't already have it, then:

```
$ brew install git
```

Xcode

Apple ships a binary package of Git with [Xcode](#).

Binary installer

Tim Harper provides an [installer](#) for Git. The latest version is [2.32.0](#), which was released 22 days ago, on 2021-07-21.

Building from Source

If you prefer to build from source, you can find tarballs on [kernel.org](#). The latest version is [2.32.0](#).

Installing git-gui

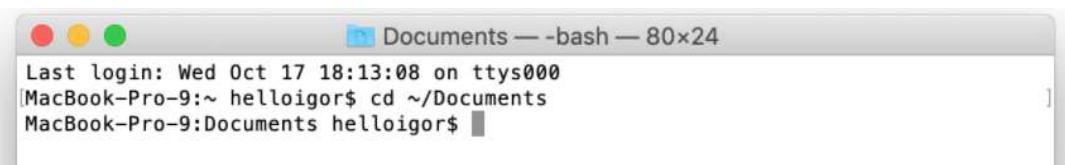

If you would like to install [git-gui](#) and [gitk](#), git's commit GUI and interactive history browser, you can do so using [homebrew](#)

```
$ brew install git-gui
```

For Linux: <https://git-scm.com/download/linux>

macOS

You may also open your Applications folder, then open Utilities and double-click on Terminal

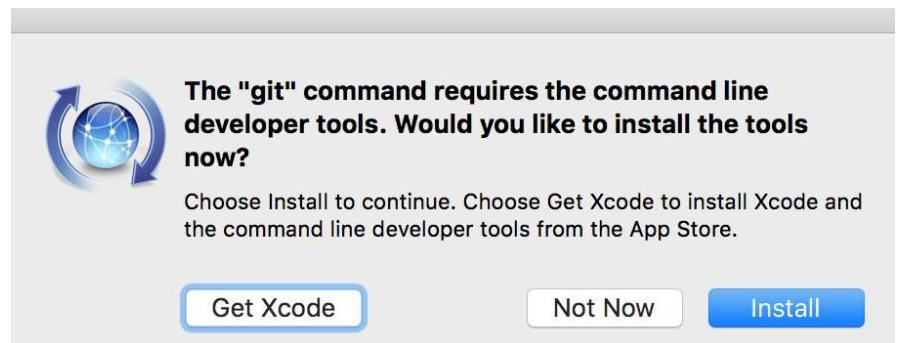

```
Documents — bash — 80x24
Last login: Wed Oct 17 18:13:08 on ttys000
[MacBook-Pro-9:~ helloigor$ cd ~/Documents
MacBook-Pro-9:Documents helloigor$
```

Type in the command prompt

\$ git version

This will launch the following message, click "Install":

setx HOME

```
setx HOME C:\Users\julianlin\GIT\GitHuan
```

Create SSH

```
pwd
```

```
julianlin@JULIANLIN- MINGW64 ~
$ pwd
/c/Users/julianlin
```

```
cd $HOME
mkdir .ssh
cd .ssh
```

```
cd $HOME
mkdir .ssh
cd .ssh
```

```
julianlin@JULIANLIN- MINGW64 ~/ssh
$ pwd
/c/Users/julianlin/.ssh
```

Enter these

1. ssh-keygen -t rsa -C "git1@visualcomms.com"
2. ./git_id_rsa
3. Enter (passphrase empty)
4. Enter (again)

Result:

```
julianlin@JULIANLIN- MINGW64 ~/ssh
$ ssh-keygen -t rsa -C "git1@visualcomms.com"
Generating public/private rsa key pair.
Enter file in which to save the key (/c/Users/julianlin/.ssh/id_rsa): ./git_id_rsa
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in ./git_id_rsa
Your public key has been saved in ./git_id_rsa.pub
The key fingerprint is:
SHA256:W0blwf8Fah+qJJzmsq0TggSnr7XeIvMrW8F0vcRe8eU git1@visualcomms.com
The key's randomart image is:
+---[RSA 3072]---+

GIT HELP

 MINGW64:/c/Users/julianlin/GIT/GitWendy/cloning/git-test

```
julianlin@JULIANLIN- MINGW64 ~/GIT/GitWendy/cloning/git-test (master)
$ git help
usage: git [--version] [--help] [-c <path>] [-c <name>=<value>]
           [--exec-path[=<path>]] [--html-path] [--man-path] [--info-path]
           [-p | --paginate | -P | --no-pager] [--no-replace-objects] [--bare]
           [--git-dir=<path>] [--work-tree=<path>] [--namespace=<name>]
           [--super-prefix=<path>] [--config-env=<name>=<envvar>]
           <command> [<args>]
```

These are common Git commands used in various situations:

start a working area (see also: git help tutorial)

clone	Clone a repository into a new directory
init	Create an empty Git repository or reinitialize an existing one

work on the current change (see also: git help everyday)

add	Add file contents to the index
mv	Move or rename a file, a directory, or a symlink
restore	Restore working tree files
rm	Remove files from the working tree and from the index
sparse-checkout	Initialize and modify the sparse-checkout

examine the history and state (see also: git help revisions)

bisect	Use binary search to find the commit that introduced a bug
diff	Show changes between commits, commit and working tree, etc

GIT INIT

```
julianlin@JULIANLIN- MINGW64 ~/GIT/GitWendy/cloning
$ mkdir git-test

julianlin@JULIANLIN- MINGW64 ~/GIT/GitWendy/cloning
$ cd git-test/

julianlin@JULIANLIN- MINGW64 ~/GIT/GitWendy/cloning/git-test
$ git init
hint: Using 'master' as the name for the initial branch. This default branch name
hint: is subject to change. To configure the initial branch name to use in all
hint: of your new repositories, which will suppress this warning, call:
hint:
hint:   git config --global init.defaultBranch <name>
hint:
hint: Names commonly chosen instead of 'master' are 'main', 'trunk' and
hint: 'development'. The just-created branch can be renamed via this command:
hint:
hint:   git branch -m <name>

```

Git Commit

- Commit changes
 - \$ git commit
 - Need to add in comments for the commit to take effect
 - In mac, the default editor is vi, it starts in command mode
 - Press “escape” and “i” to enter insert mode
 - Enter some comments
 - Press “escape” and “:x” to exit and save
 - Check the status again

```
MINGW64:/c/Users/julianlin/GIT/GitWendy/cloning/git-test
# Please enter the commit message for your change
# with '#' will be ignored, and an empty message
#
# On branch master
#
# Initial commit
#
# Changes to be committed:
#       new file: README.md
#       new file: README2.md
#
#
```

Adding the -a option to the git commit command makes Git automatically stage every file that is already tracked before doing the commit, letting you skip the git add part.

MINGW64:/c/Users/julianlin/GIT/GitWendy/cloning/git-test

```
This is committing two read files

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? [Import a repository](#).

Owner *

 git1-visualcomms-com 

Repository name *

 / git-test 

Great repository names are short and memorable. Need inspiration? How about [jubilant-adventure](#)?

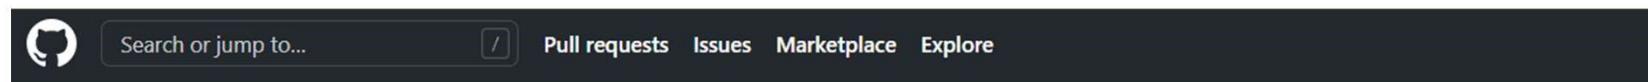

Description (optional)

 **Public**

Anyone on the internet can see this repository. You choose who can commit.

 **Private**

You choose who can see and commit to this repository.

git1-visualcomms-com / **git-test**

Code Issues Pull requests Actions Projects Wiki Security Insights Settings

Quick setup — if you've done this kind of thing before

[Set up in Desktop](#) or [HTTPS](#) [SSH](#) `git@github.com:git1-visualcomms-com/git-test.git`

Get started by [creating a new file](#) or [uploading an existing file](#). We recommend every repository include a [README](#), [LICENSE](#), and [.gitignore](#).

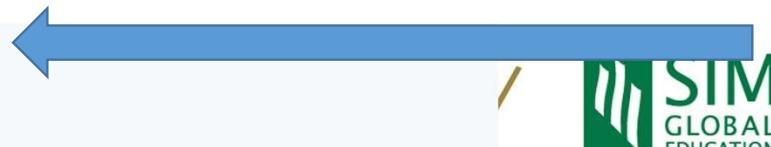

...or create a new repository on the command line

```
echo "# git-test" >> README.md
git init
git add README.md
git commit -m "first commit"
git branch -M main
git remote add origin git@github.com:git1-visualcomms-com/git-test.git
git push -u origin main
```

```
julianlin@JULIANLIN- MINGW64 ~/git-test (master)
$ git remote add origin git@github.com:git1-visualcomms-com/git-test.git
julianlin@JULIANLIN- MINGW64 ~/git-test (master)
```

...or push an existing repository from the command line

```
git remote add origin git@github.com:git1-visualcomms-com/git-test.git
git branch -M main
git push -u origin main
```

```
julianlin@JULIANLIN- MINGW64 ~/git-test (master)
$ git remote -v
git-test      git1@visualcomms.com (fetch)
git-test      git1@visualcomms.com (push)
origin  git@github.com:git1-visualcomms-com/git-test.git (fetch)
origin  git@github.com:git1-visualcomms-com/git-test.git (push)
```

```
julianlin@JULIANLIN- MINGW64 ~/git-test (master)
$ git push -u origin master
Enumerating objects: 17, done. ←
Counting objects: 100% (17/17), done.

Moving Delete to Staging Area!

To Unstage it .. i.e., to restore it

We can then commit it!

git clone

- clone
- Copy the clone URL from GitLab

- In command line type:
 - \$ git clone <YOUR URL>

Exercise (10 minutes):

- Create three python files (test1.py, test2.py and test3.py) in the working directory
- Commit and push it to the server.

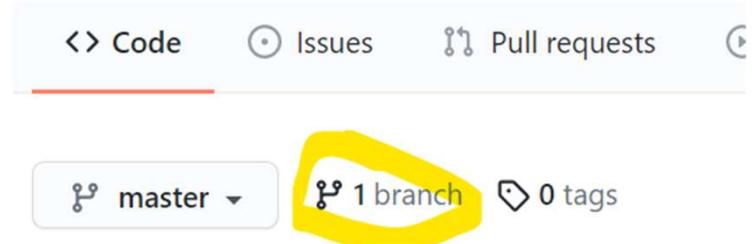

Branching

- In many VCS tools, this is a somewhat expensive process, often requiring you to create a new copy of your source code directory, which can take a long time for large projects.
- The way Git branches is incredibly lightweight, making branching operations nearly instantaneous, and switching back and forth between branches generally just as fast.
- Unlike many other VCSs, Git encourages workflows that branch and merge often, even multiple times in a day. Understanding and mastering this feature gives you a powerful and unique tool and can entirely change the way that you develop.
- More info: <https://git-scm.com/book/en/v2/Git-Branching-Branches-in-a-Nutshell>

Branching

- Create a new branch

- \$git branch testingdemo1

- Switch to the new branch

- \$git checkout testingdemo1
 - Make some changes in the codes
 - Commit the changes

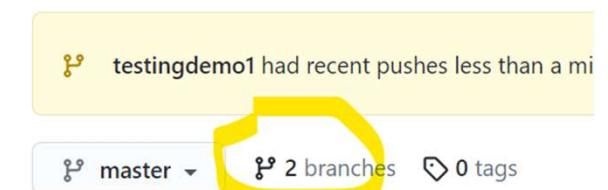

- git commit -a

- Push the changes to server (including the new branch)

- \$git push --set-upstream origin testingdemo1

```

git merge

Delete the branch

The NEW edit replaced the old one

Summary: Merging

- Make sure you are currently in master branch
 - `$ git checkout master`
- Merge `testingdemo1` into master
 - `$git merge testingdemo1`
- Since the work in `testingdemo1` is merged into master and is no longer required, we can delete the branch
 - `$ git branch -d testingdemo1`
- At this point of time, the server branch is not deleted yet, to delete:
 - `$ git push origin --delete testingdemo1`
- <https://git-scm.com/book/en/v2/Git-Branching-Basic-Branching-and-Merging>

Merging with conflict

- Create a new branch
 - \$ git branch test
- In the test branch, add in a new line to one of the file
- In the master branch, add in another new line in the “same” file.
- In the master branch, try to merge test branch into master
 - You will encounter an error
 - See the status (\$git status) to identify which file in conflict.
 - Open the conflict file and resolve those conflicts. (next slide)

```
[Wendy git-test]$ git checkout master
Switched to branch 'master'
Your branch is up to date with 'origin/master'.
[Wendy git-test]$ git merge anotherbranch1
Auto-merging README2.md
CONFLICT (content): Merge conflict in README2.md
Automatic merge failed; fix conflicts and then commit to [ ] result.
[Wendy git-test]$ git stats
git: 'stats' is not a git command. See 'git --help'.

The most similar command is
    status
[Wendy git-test]$ git status
On branch master
Your branch is up to date with 'origin/master'.

You have unmerged paths.
  (fix conflicts and run "git commit")
  (use "git merge --abort" to abort the merge)

Changes to be committed:
  new file: README4.md
  new file: README5.md

Unmerged paths:
  (use "git add <file>..." to mark resolution)
    both modified: README2.md

Merging with conflict

- Resolve those conflicts
 - To see the beginning of the merge conflict in your file, search the file for the conflict marker <<<<<. When you open the file in your text editor, you'll see the changes from the HEAD or base branch after the line <<<<< HEAD. Next, you'll see =====, which divides your changes from the changes in the other branch, followed by >>>>> BRANCH-NAME.
 - <https://docs.github.com/en/github/collaborating-with-issues-and-pull-requests/resolving-a-merge-conflict-using-the-command-line>
- **\$ git mergetool**
- After resolving the conflicts, commit the changes
- Push the changes to the server.
- Delete the branch.

```
